

Send2U Fix Sweep: CEO Review

Four-agent run (Architect → Coder → Tester → Manager) against ~/Documents/GitHub/send2u. Branch **main**, 5 new commits, nothing pushed, no database changes.

What was built

Five commits that fix **nine defects** in the money and order-state path, plus the project's **first test suite** (43 tests, none existed before). The 2026-09-18 platform-managed Online/COD migration was verified as already correct and was not re-audited.

282dae3b	Commits the three pending ratings-gate fixes from your last session, unchanged.
8cbd3d16	Fixes 3 money/status defects; adds the 43-test suite.
135d3aff	Closes 4 findings from the adversarial QA pass.
a496ff07	Closes 2 findings from the manager review.
79e5d2f5	Restores one dropped branch; corrects two false changelog claims.

The nine defects

- **Customer would be told the wrong thing about money:** an online order that was still unpaid displayed “Cash due on delivery”, and elsewhere “Paid in Send2U”. Both now follow the real payment state and the payment rail.
- **A vendor could be charged 100x on a price:** typing a comma decimal such as 6, 50 silently created an RM 650.00 menu item instead of RM 6.50. It now rejects a misplaced comma instead of misreading the amount.
- **Status labels rendered as broken English:** “Ready For Pickup”, “Out For Delivery”. Now sentence case.
- **A cancelled order was prompted to pay:** “Not paid yet, pay now” next to its own “Cancelled” status. Payment prompts are now suppressed for finished orders.
- **Each sweep changelog entry was recorded twice**, and one entry said something untrue about the test suite. Both corrected.

How it was verified

TypeScript	npx tsc --noEmit: clean (exit 0)
Tests	npm test: 43 of 43 pass (was 0 tests before)
Lint	npx expo lint: clean (exit 0)
Bundle	npx expo export -p web: passes, all routes build
Mutation check	Breaking the unread store on purpose makes 5 tests fail, so those tests are real.
QA pass	An independent adversarial agent reproduced the fixes and then broke its own 13 mutant checks.

Review passes

Two independent manager reviews, run on the work and then on the fixes themselves.

What still needs your decision

- **One changelog file, two git paths.** `CHANGELOG.md` and `change log.md` are the *same file* on your machine (macOS is case-insensitive), but git tracks both. That is what caused the duplicated entries. Collapsing to one path is a repo-structure call, so I did not make it.
- **Were old completed orders backfilled?** The new ratings gate accepts `paid/collected`. If any completed order still carries the legacy `payment_status='verified'`, it is now unratable. I could not check without database access.

Known limits, stated plainly

- Nothing was tapped through on a real device. The fixes are proven by tests and by the type, lint and bundle checks, not by using the app.
- No database or RPC change was made, by design.
- Disk is at 99% (2.2 GB free). The next heavy native build may run out of space.
- The last commit (one restored line plus documentation) did not get a fourth adversarial pass. It is verified by inspection and all gates pass.

What you should check by hand

- Open a vendor menu item and type 6,50 into the price field. It must refuse, not become RM 650.00.
- As a requester with an unpaid online order, open the order detail. It must not say paid or cash due: it should read “Not paid yet”.
- Cancel an unpaid order and re-open it. The order summary must not prompt you to pay.
- Check a helper's Deliveries list reads “Ready for pickup”, not “Ready For Pickup”.

Full detail: `TEAM/report.md` (what changed), `TEAM/test-report.md` (adversarial QA), `TEAM/review.md` (two manager reviews), `TEAM/history.md` (iteration log).
